

Design specification for the final system Feedback

Group	16
Document Version	1.5 Released
Overall grade	C-

1. Document, References and Document Change History (A)

Reference is not complete – version, author(s).

2. Deployment Description (A)

No significant changes have been made since the outline version.

3. Interaction Design (B)

Some improvements have been made to the use case diagrams since the outline version.

4. TaskerMAN design (F)

There is no design for TaskerMAN. Each page in 3.2 will need a URL, perhaps with parameters. Those URLs will need one or more PHP files to respond to them. What are those files, how do they use parameters, what functions do they contain. How is the HTML created, how and when are data exchanged with the database?

5. TaskerCLI design (B)

The process of synchronisation (which data are copied where) and its initiation (regularly and associated with edits) is not made clear. The mechanism and format for local data storage is not described. The location of the `ArrayList<Task>` is not clear.

6. TaskerSRV and data transmission design (B)

Task elements, with individual descriptions and comments, are not obviously catered for. This is missing from the UI and has followed through to here. The table descriptions will allow for JDBC and PHP library calls to be made to retrieve appropriate data.
